1. It runs on a phone

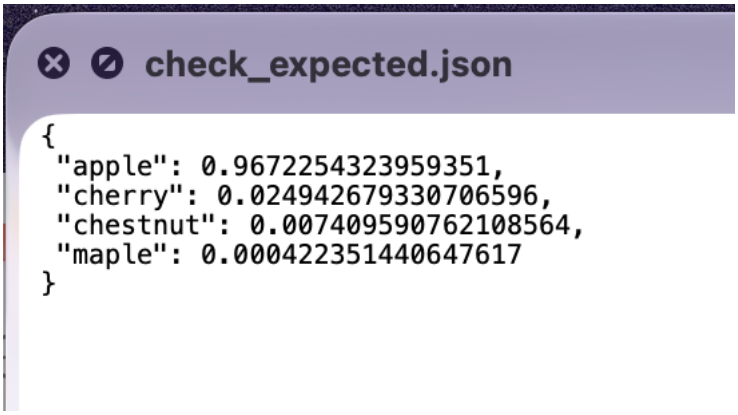

The page loads and classifies the reference photo in WebKit.

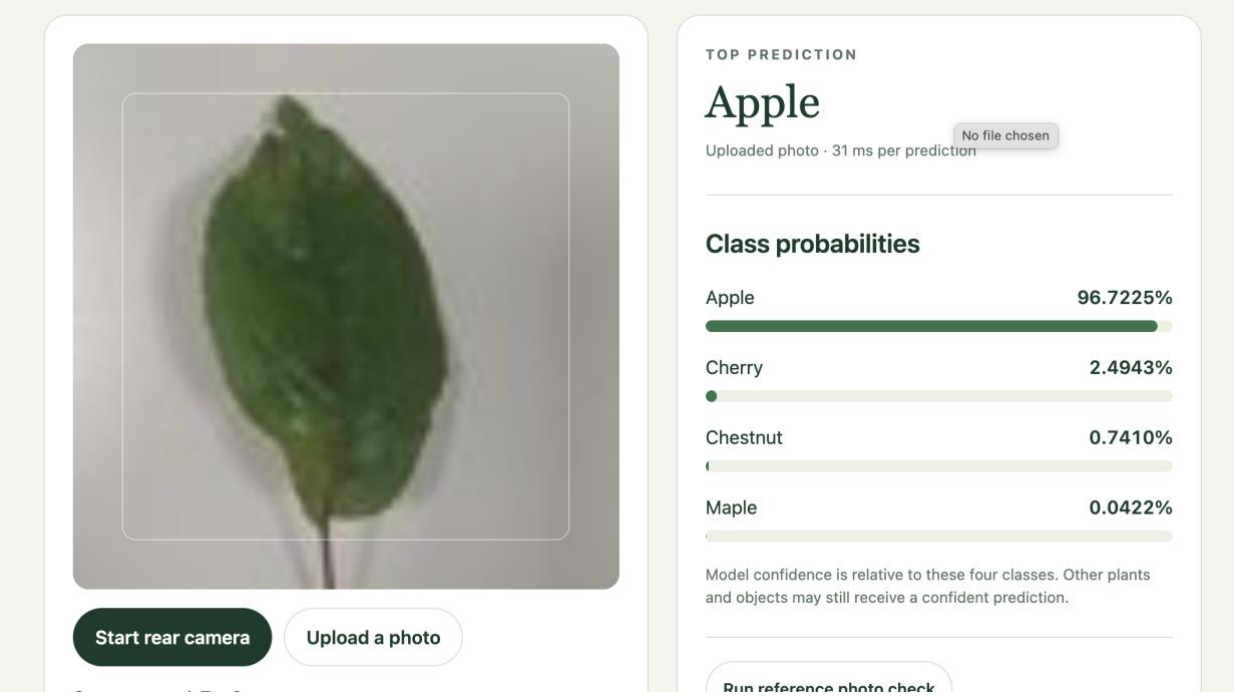

Screenshot:

2. Same numbers as the notebook
Yes, the displayed numbers are rounded to 4th decimal and they are exactly the same.

Screenshots:

3. Preprocessing matches the model

The preprocessing matches model_info.json: it crops the center, resizes the image, scales the pixel values, and normalizes them. The tensor stores the red, green, and blue channels in that order, and both camera frames and uploaded photos use the same process.

The transform notebook is missing.

4. Nothing leaves the phone

Leaf image contents and predictions stay on the device in the reviewed application. ‚ÄúNothing leaves the phone‚Äù does not mean ‚Äúno network traffic‚Äù: GitHub Pages and jsDelivr receive ordinary connection/request metadata, such as the visitor's IP address and requested asset URL. The page also trusts the downloaded third-party JavaScript to execute in the browser. No image transmission was found in the reviewed code or observed upload test.
